

Corrections I had to make:

- Adding labels to any input forms
- Adding ARIA labelling to anything I used as a tabindex/anything that had user interaction enabled and adding ARIA labelling to the navbar.
- Adding alternative text to all the images.

Given that the photos and captions rely on user-generated content, do you think that the accessibility problems are all solvable? Why or why not?

I added alternative text to every image but the alternative text was just "first name last name photo purpose" e.g. "Rhonda West posted image". I think it would be possible to solve accessibility problems using image recognition software but it obviously wouldn't be perfect, and it would still not be the same user experience as someone who wasn't disabled (e.g. visually impaired).

Do you think your website is usable if you turn off the CSS? Why or why not?

Yes because the elements are grouped in divs and although it would be messy and the user experience would be much worse, it would still be navigable

Do you think your website is usable if you turn off the images? Why or why not?

No because the entire purpose of this website is to share images (as posts) and turning the images off would leave nothing to comment about and no one would use it (therefore not usable).
